EPFL Background : Urban planning and human living experience

West Lake, Hangzhou, China

Hangzhou urban planning map^[1]

Hangzhou function diversity hot and cold spot map^[1]

Hot Spot (99%)

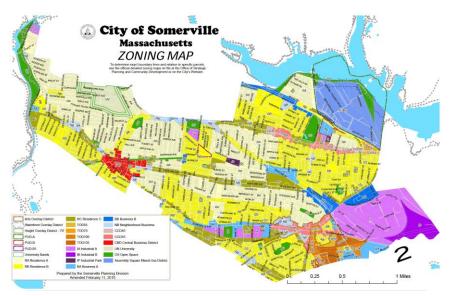

Extraordinary view existence \neq Good living experience !

1. Qiu, Yining, et al. "Understanding the urban life pattern of young people from delivery data." Computational Urban Science 1 (2021): 1-16.

EPFL Background

More challenging urban design exists...

• Euclidean zoning (areas with specific rules for building use)

Jeopardizing vibrant and socially resilient communities^[1] 2. Jacobs, J. (1961). The Death and Life of Great American Cities. New York. Question: What kind of urban design is considered benefiting internal individual residents and society?

Objective: Understanding human's

interaction with urban forms

OUTLINE

Data Exploration

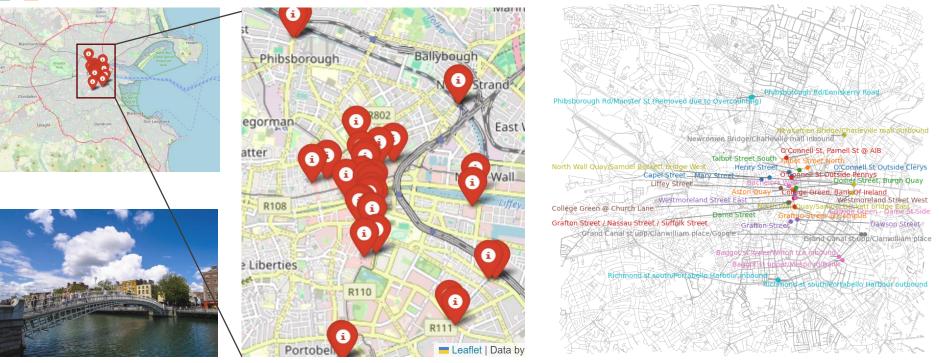

- Pedestrian Counts
- > Urban Forms
- > Other Features

Model Regression & Interpretation

EPFL Data – Pedestrian Counts : Sensor Locations

Dublin

Data

• 34 pedestrian counters

• Densely distributed around central region

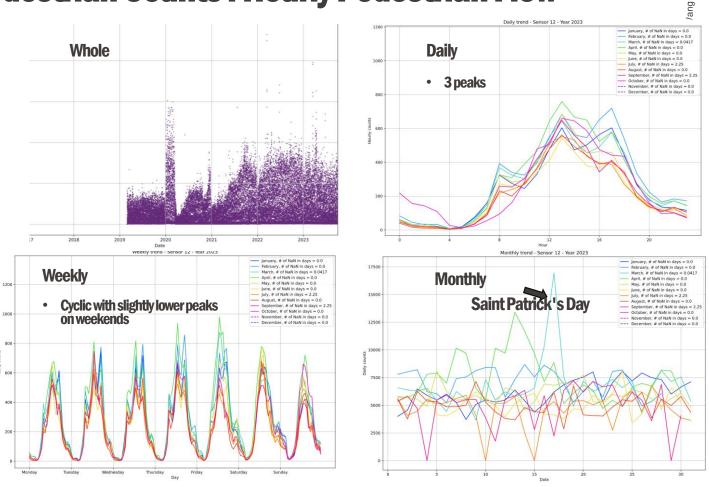

Yihan Wang

Sensor Locations on Street Network in a region in Dublin

EPFL Data – Pedestrian Counts : Hourly Pedestrian Flow

Sensor ID: 12

College Green, Bank of Ireland

OUTLINE

Data Exploration

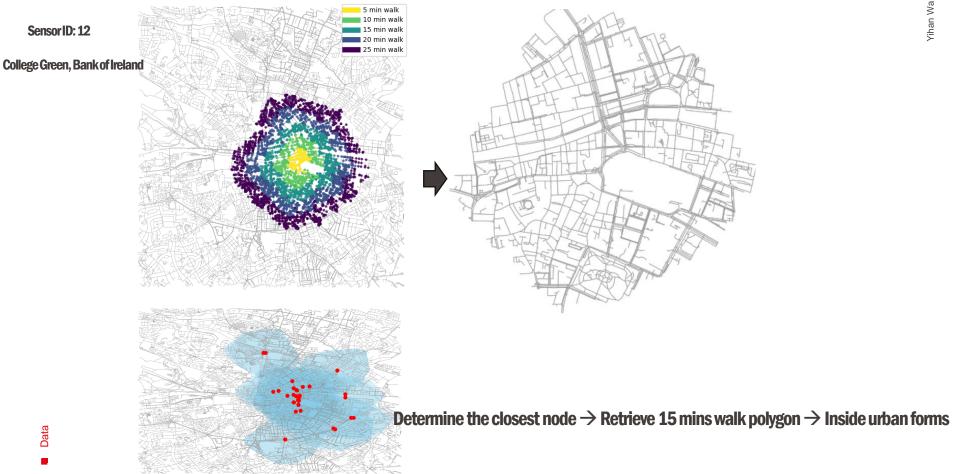

> Pedestrian Counts

Urban Forms

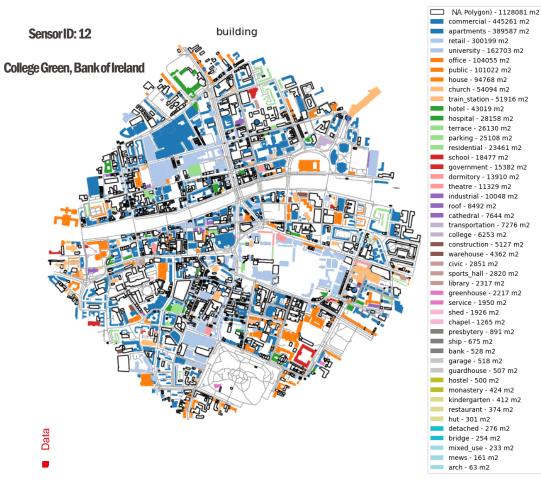

> Other Features

Model Regression & Interpretation

EPFL **Data - Urban Forms: From Counter Nearest Node Polygon**

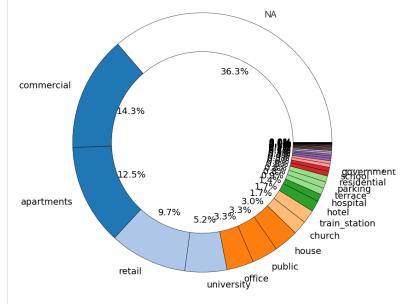

EPFL Data - Urban Forms: Polygon Urban Forms

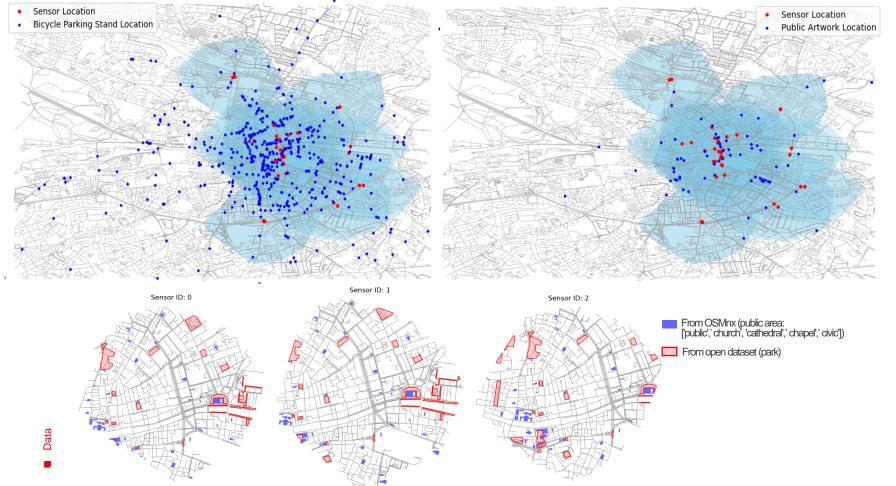

Total Area of Each Building Type (Ordered by Area) within the 15 min

walk distance from College Green Counter

EPFL Data - Urban Forms: Polygon Urban Forms

10

OUTLINE

Data Exploration

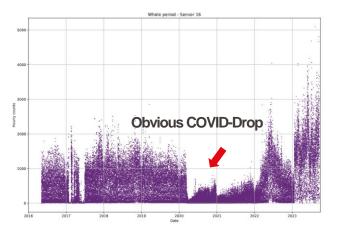

- > Pedestrian Counts
- > Urban Forms
- > Other Features

Model Regression & Interpretation

EPFL Model – Data Preprocessing

• Filtering out data with COVID-19 restrictions: (\rightarrow 4115348 \times 135 dataframe)

Restrictions including:

- School Closing
- Workplace Closing
- Cancel Public Events
- Restrictions on Gatherings
- Close Public Transports
- Protection of elderly people

- Stay at Home Requirements
- Restrictions on Internal Movement
- International travel controls
- Restrictions on Gatherings
- Contact Tracing
- Facial Coverings

- One-hot encoding for categorical features
- **Z** score Standardization: $x_{i,j}' = \frac{x_{i,j} min(x_j)}{max(x_i) min(x_j)}$
- Normalization: $x'_{i,j} = \frac{x_{i,j} mean(x_j)}{std(x_j)}$
- Deal with NaN values: fill with feature means

EPFL Model – Setup

Interpretable model: linear regression

| Dependent Variable | | Hourly pedestrian counts | | Perimeter Mean | Recreational | PopSum | distance | B15_Comm ercial_per | B5_others_ per | S15_street_le ngth_avg |

Features including: weather, urban form, network property, population...

13

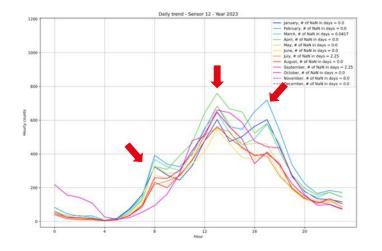

Yihan Wang

EPFL Model – Exploration

• Plain model: R² = 0.287

Model

• Baseline model: Categorizing hour in day: R² = 0.523

- Morning Peak: 7, 8, 9
- Lunch Peak: 12, 13, 14
- Evening Peak: 16, 17, 18

Hour categorization helps explaining the variation a lot!

Adding a predictor of 'year': $R^2 = 0.538$

Other temporal predictor remains unexplored

EPFL **Model – Exploration**

Baseline model: $R^2 = 0.523$

Exploring feature interactions: $R^2 = 0.545$

Included interactions

Intuition: For population groups, the fractions are more meaningful.

Model

Intuition: Young people may be influenced by day type more

| | Men / PopSum | Youth * Commercial | <day_type *="" institutional=""></day_type> | < day_type * B15_Commercial_per > | | | | |
|--|---|---|--|---------------------------------------|--|--|--|--|
| | Youth / PopSum | Youth * Entertainment | <day_type *="" recreational=""></day_type> | < day_type * B15_ Religious_per > | | | | |
| | Children / PopSum | PopSum * Commercial | <day_type *="" o15_greenarea_m2=""></day_type> | < day_type * B5_ Religious_per > | | | | |

17

- EPFL Summary
 - Explored and analyzed urban features from open datasets.
 - Developed mathematical models statistically explaining the spatial-temporal relationship between pedestrian flow and different groups of features.
 - Implemented traditional machine learning techniques, improving the model R² up to 0.580, with Luis F. Miranda-Moreno et al.^[1] highest R² = 0.60.

Yihan Wang
